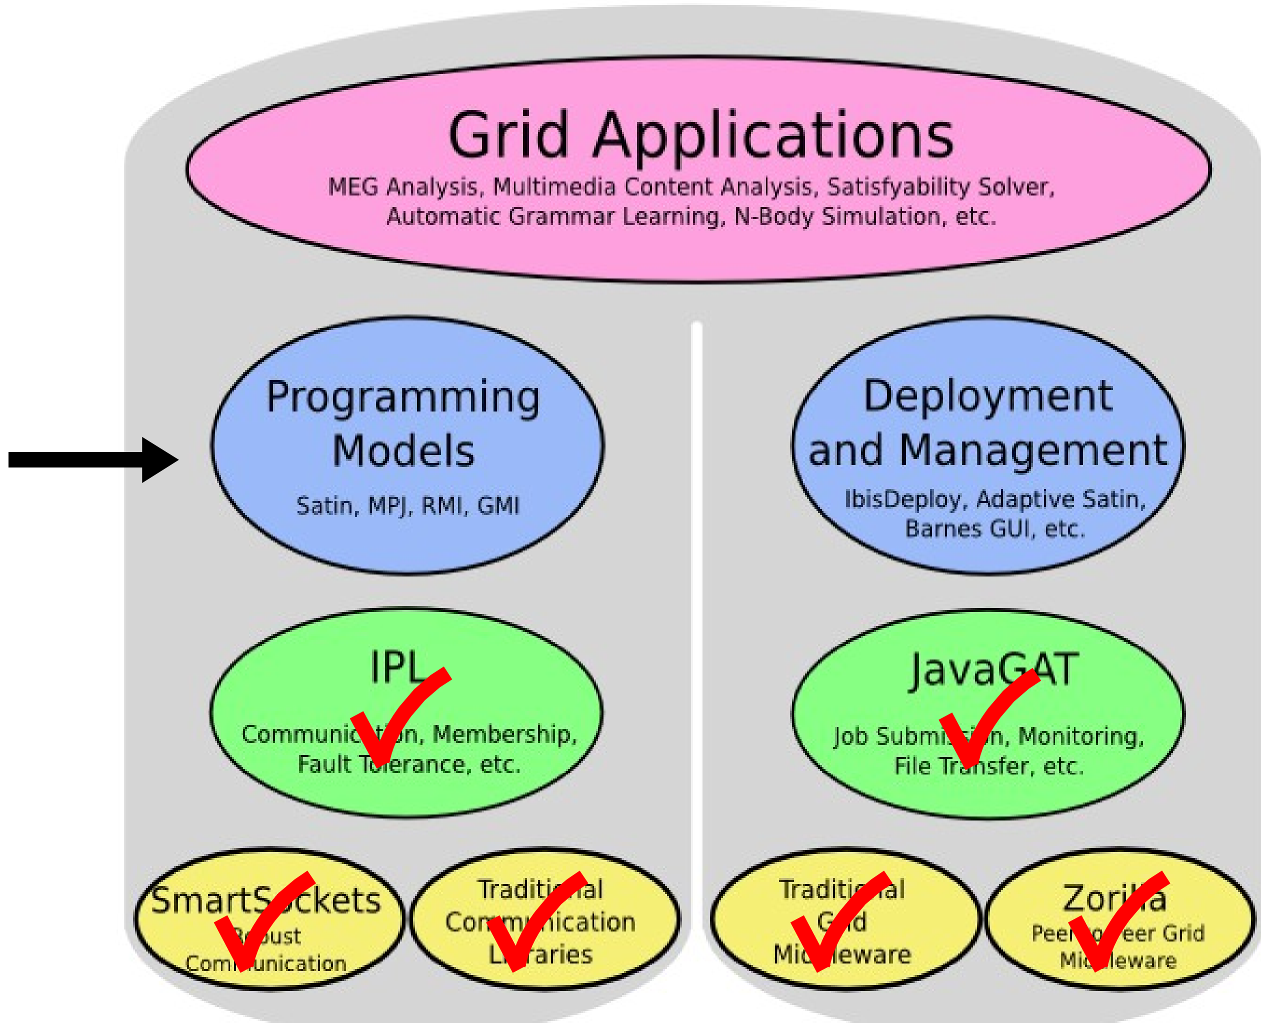
Satin

Rob van Nieuwpoort
*rob@**cs.vu.nl***

Until now...

- We looked at how Ibis makes deployment user friendly:
  - JavaGAT provides an easy-to-use API for the various flavours of Grid middleware
  - Zorilla provides a configuration free alternative to existing Grid middleware
- We discussed:
  - Communication
  - IPL model
- Next Step:
  - High-level grid programming models

Overview



Grid Applications
MEG Analysis, Multimedia Content Analysis, Satisfyability Solver,
Automatic Grammar Learning, N-Body Simulation, etc.
Programming Models
Satin, MPJ, RMI, GMI
Deployment and Management
IbisDeploy, Adaptive Satin,
Barnes GUI, etc.
IPL
JavaGAT

Distributed supercomputing

- Parallel processing on geographically distributed computing systems (grids)

- Our goals:
  - Don’t use individual supercomputers / clusters, but combine multiple systems
  - Provide high-level programming support

ibis

vrije Universiteit

Optimizing for the grid

- Grids usually are hierarchical
  - Collections of clusters, supercomputers
  - Fast local links, slow wide-area links
- Optimize algorithms to exploit hierarchy
  - Message combining + latency hiding on wide-area links
  - Collective operations for wide-area systems
  - Successful for many applications

ibis

vrije Universiteit

Satin
master-worker

- Master-worker parallelism
  - Divide work into parts
  - Spawn job for each part
  - Solve parts in parallel
  - Combine results

vrije Universiteit

Satin divide-and-conquer

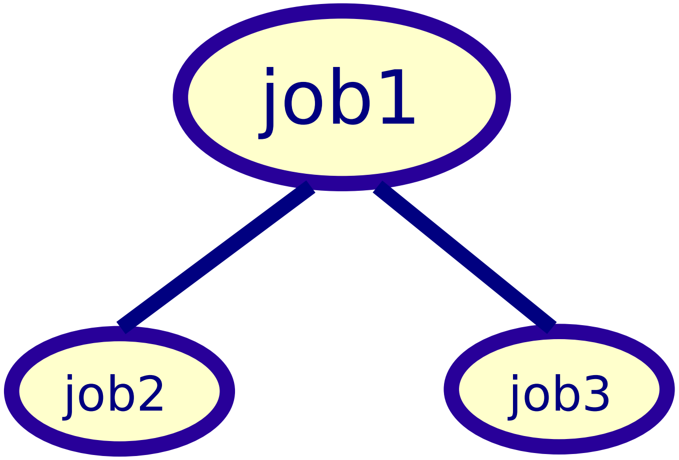
- Parallel Divide-and-conquer
  - Divide work into parts
  - Spawn job for each part
  - Solve parts in parallel
  - Combine results
  - But now recursively!
  - sub-problems split the work up further and spawn their own sub-jobs

Satin

- Divide-and-conquer

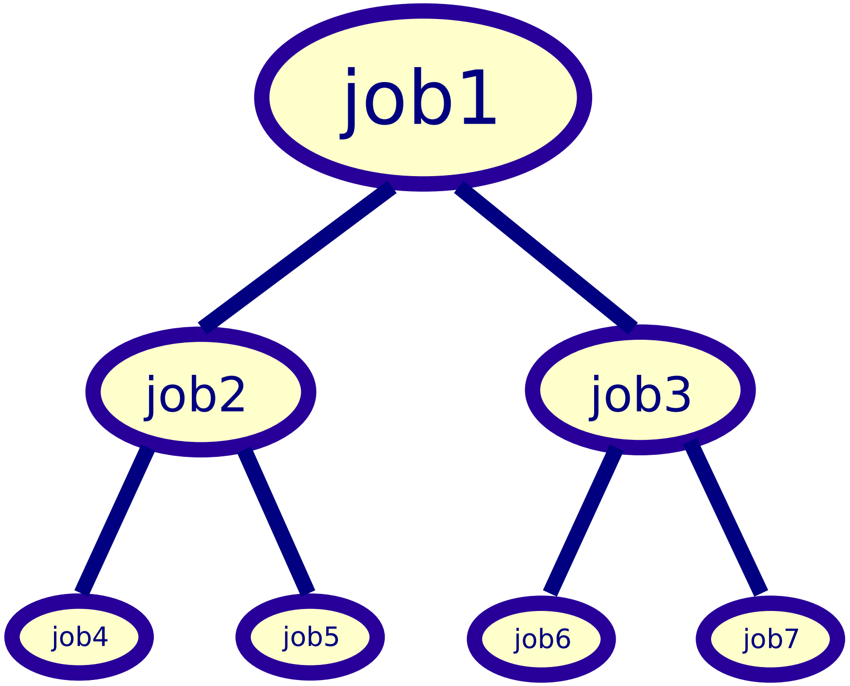
Satin

- Divide-and-conquer



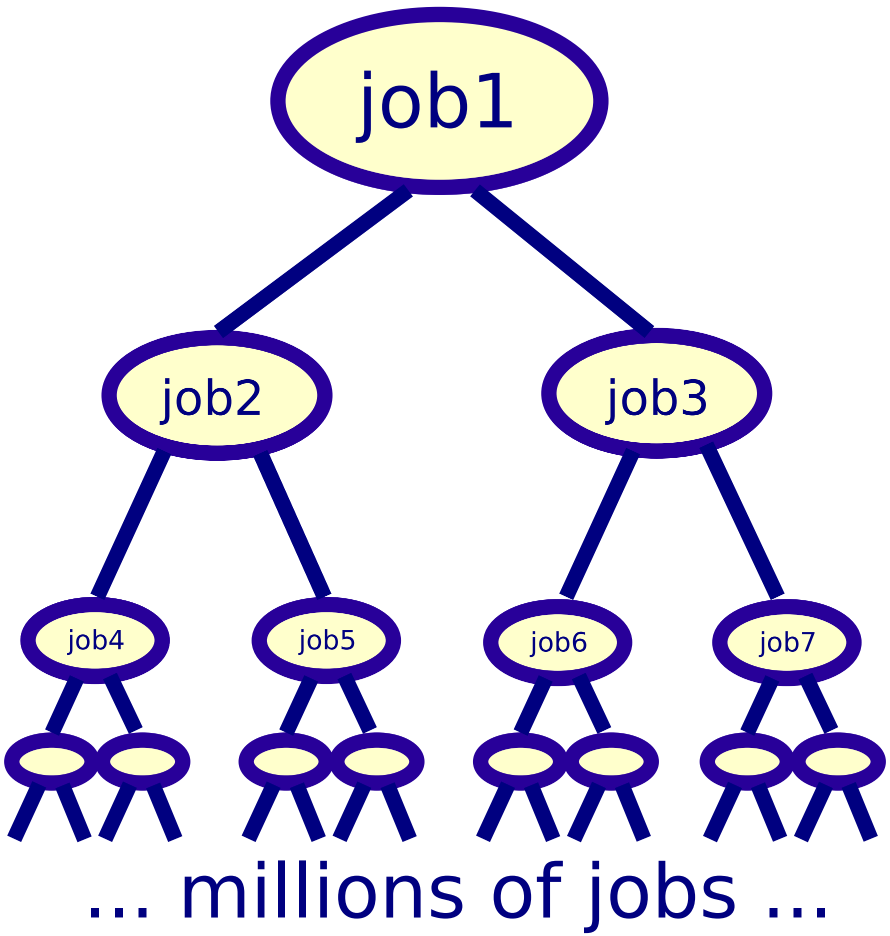
Satin

- Divide-and-conquer



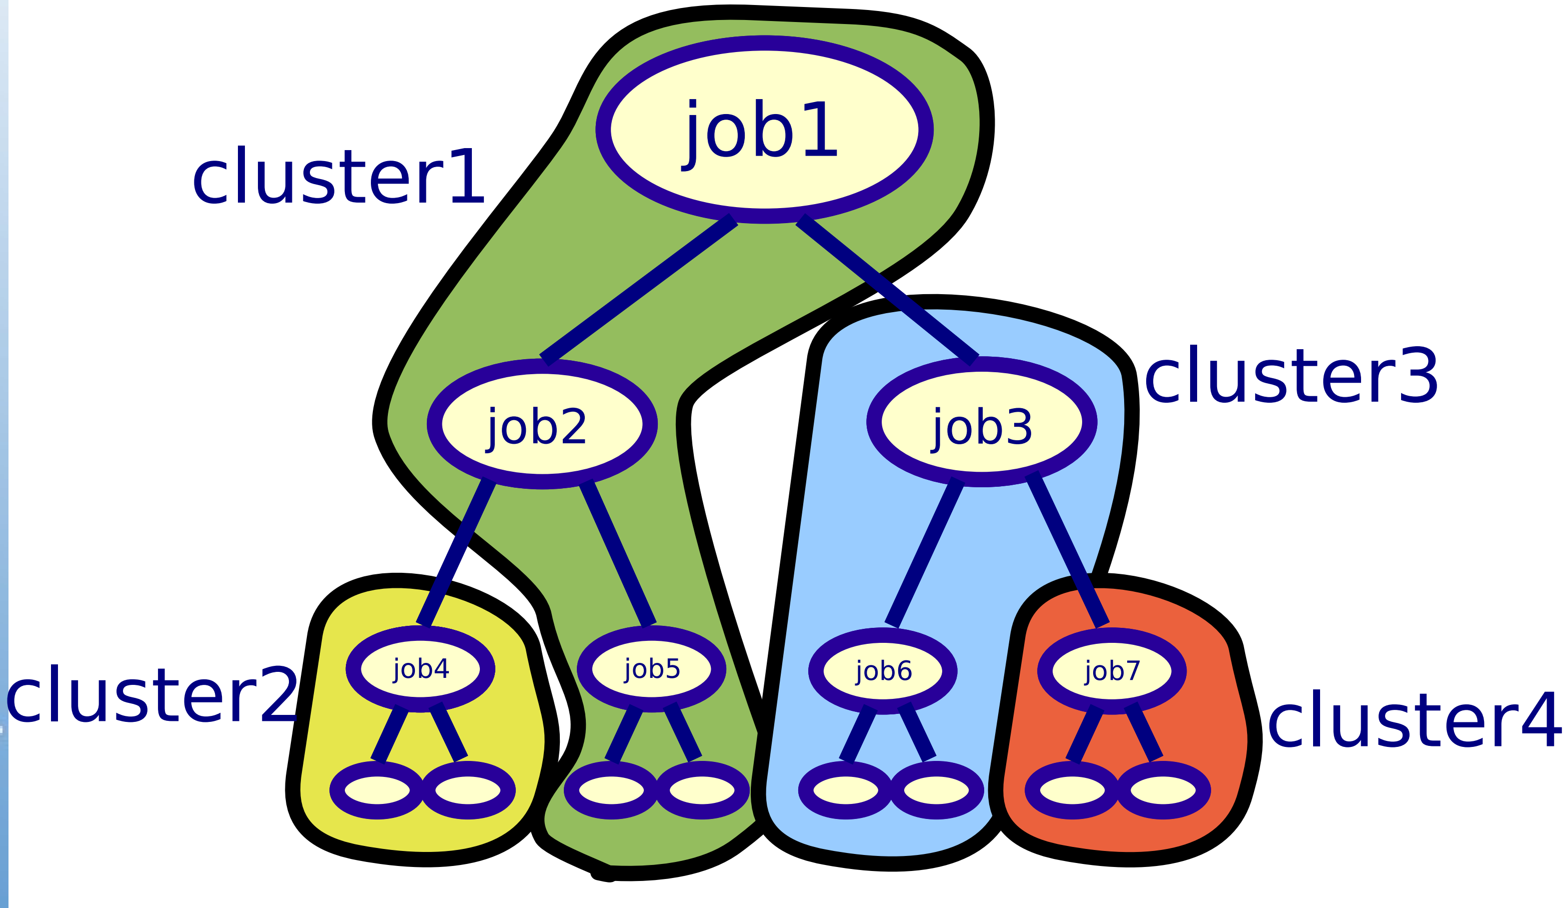
Satin

- Divide-and-conquer



Satin - Hierarchical

- Fits hierarchical structure of Grids



Sequential Fibonacci

```
public long fib(int n) {
        if (n < 2) return n;

        long x = fib(n - 1);
        long y = fib(n – 2);

        return x + y;
}
```

Parallel Fibonacci

```
interface FibInterface extends ibis.satin.Spawnable {
    public long fib(int n);
}
public long fib(int n) {
        if (n < 2) return n;

        long x = fib(n - 1);
        long y = fib(n – 2);
        sync();
        return x + y;
}
```

ibis

vrije Universiteit

Parallel Fibonacci

```
interface FibInterface extends ibis.satin.Spawnable {
    public long fib(int n);
}
public long fib(int n) {
        if (n < 2) return n;

        long x = fib(n - 1);
        long y = fib(n – 2);
        sync();
        return x + y;
}
```

Mark methods as

Spawnable.

They can run in parallel.

ibis

vrije Universiteit

Parallel Fibonacci

```
interface FibInterface extends ibis.satin.Spawnable {
    public long fib(int n);
}
public long fib(int n) {
        if (n < 2) return n;

        long x = fib(n - 1);
        long y = fib(n – 2);
        sync();
        return x + y;
}
```

Mark methods as
Spawnable.
They can run in parallel.

Wait until spawned methods are done.

ibis

vrije Universiteit

The Grid

- Satin explicitly targets the grid
- Different architectures --> Java
- Firewalls --> Ibis
- Slow networks (latency)
- Distributed memory
- Machines come and go
- Machines have different speeds
- Machines crash

Satin – Shared Objects

- Allow machines to share 'global data'
- Application controlled consistency (guard consistency)
- Allow different implementations
  - Special grid-aware multicast
  - Gossiping techniques
  - Point to point communication only

Satin – Load Balancing

- Satin distributes jobs across machines
- Need load-balancing
  - Jobs can have different sizes
  - Machines have different speeds
- Load-balancing is done automatically

Satin – Load Balancing

- Special load-balancing algorithms
  - Master-Worker (MW)
  - Multicore / singe cluster (RS)
  - Multi-cluster / grid (CRS)

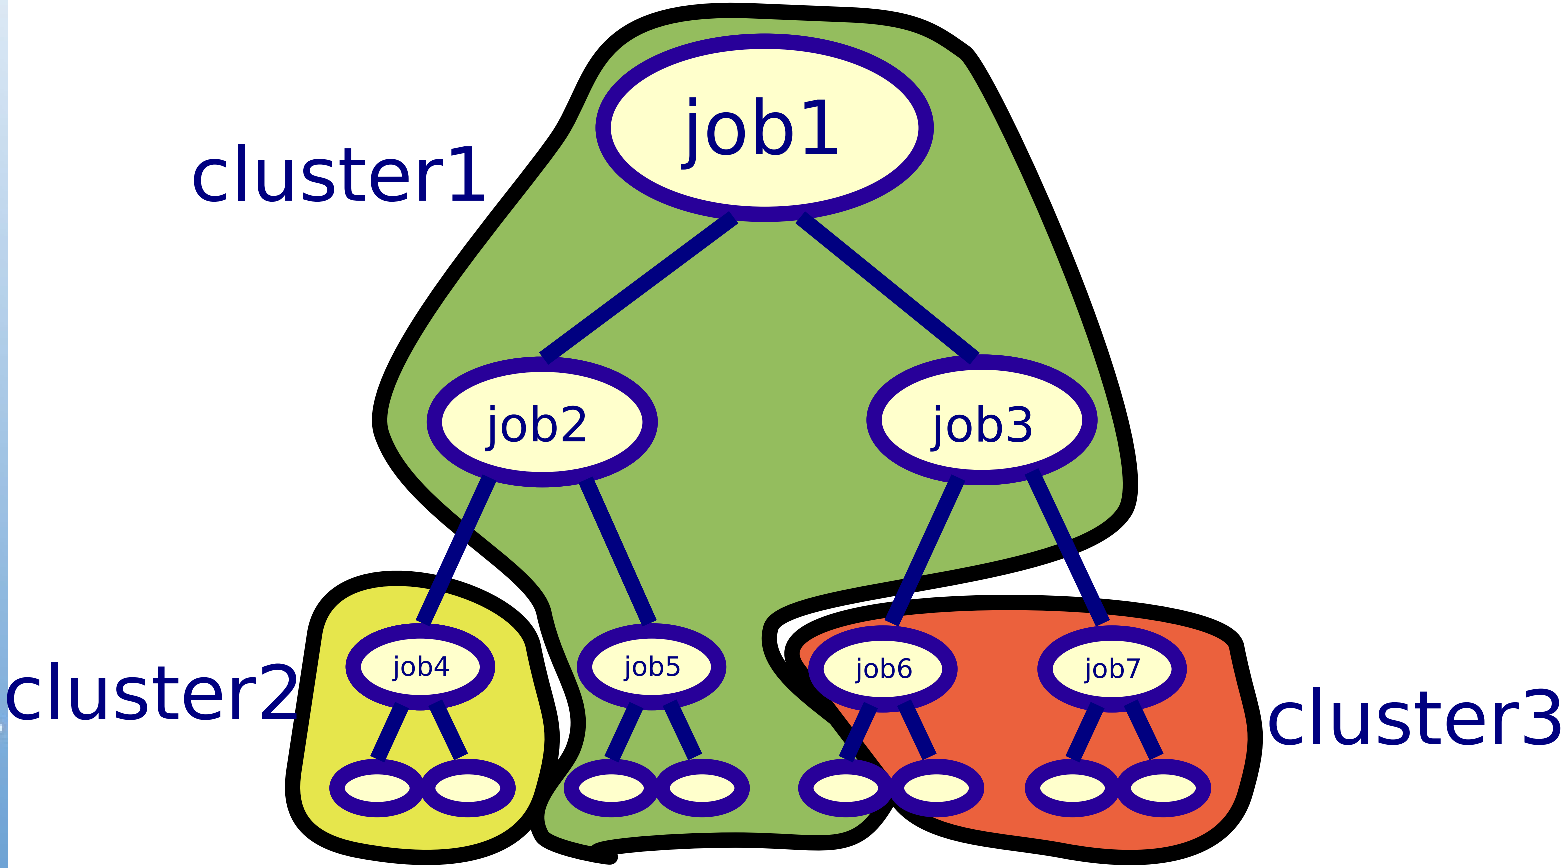
- See publications on the Ibis web site for more information

Satin – Malleability

- Add machines on the fly
  - User can add machines if computation is slow or if more resource become available
- Remove machines on the fly
  - Machines can leave gracefully
  - Reservations can end
- Transparent for application

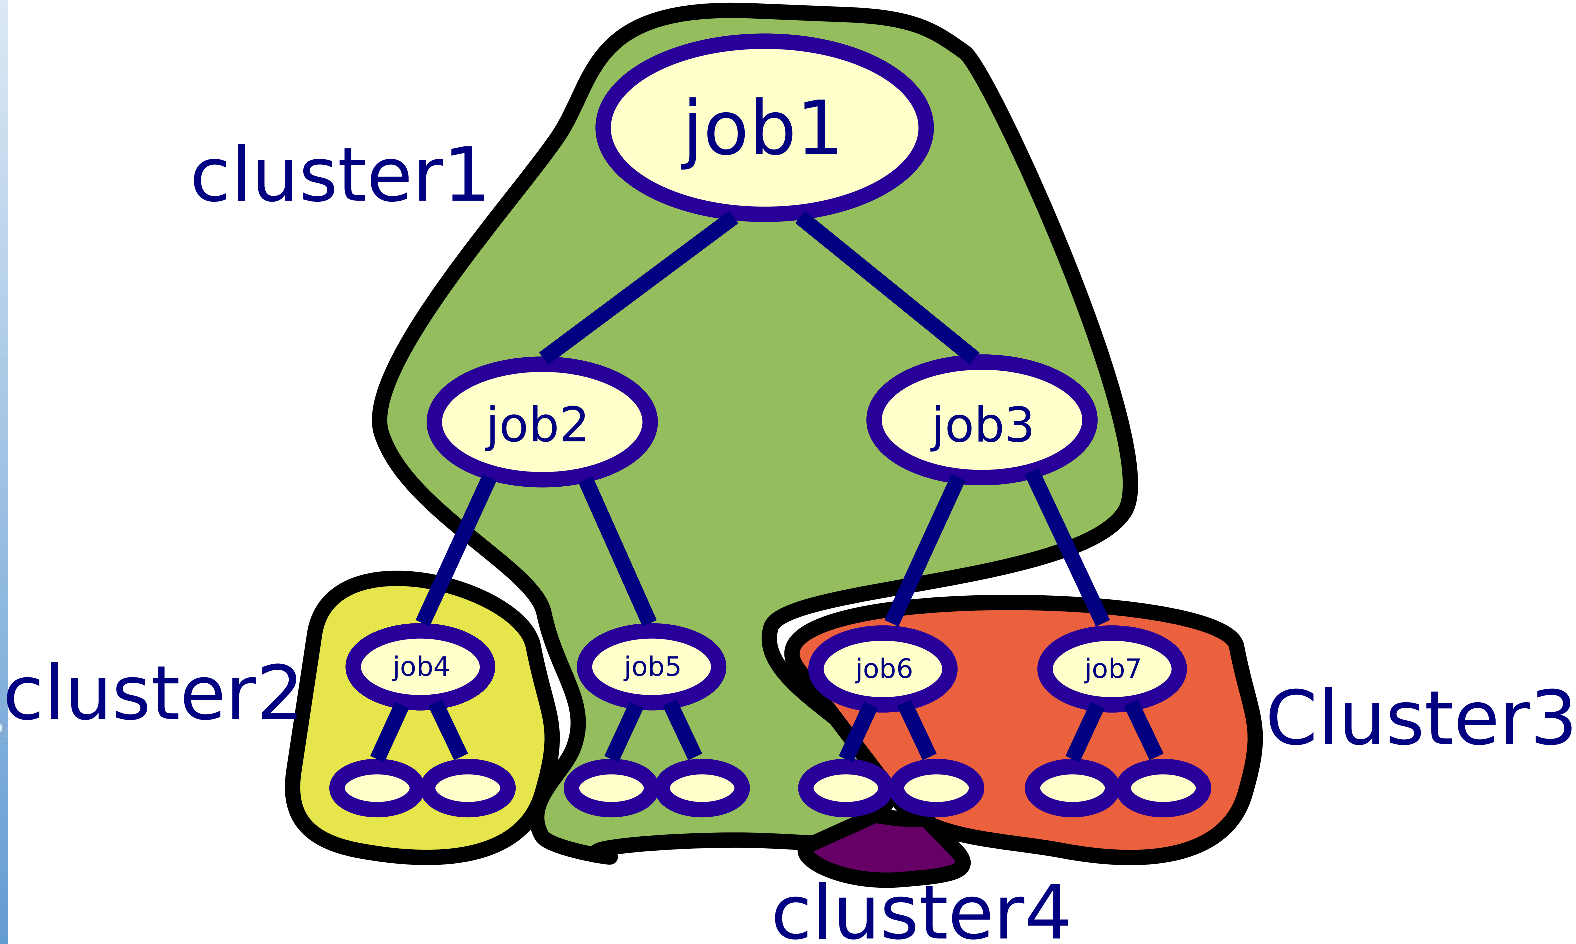
Satin – Malleability

- Transparently add machines



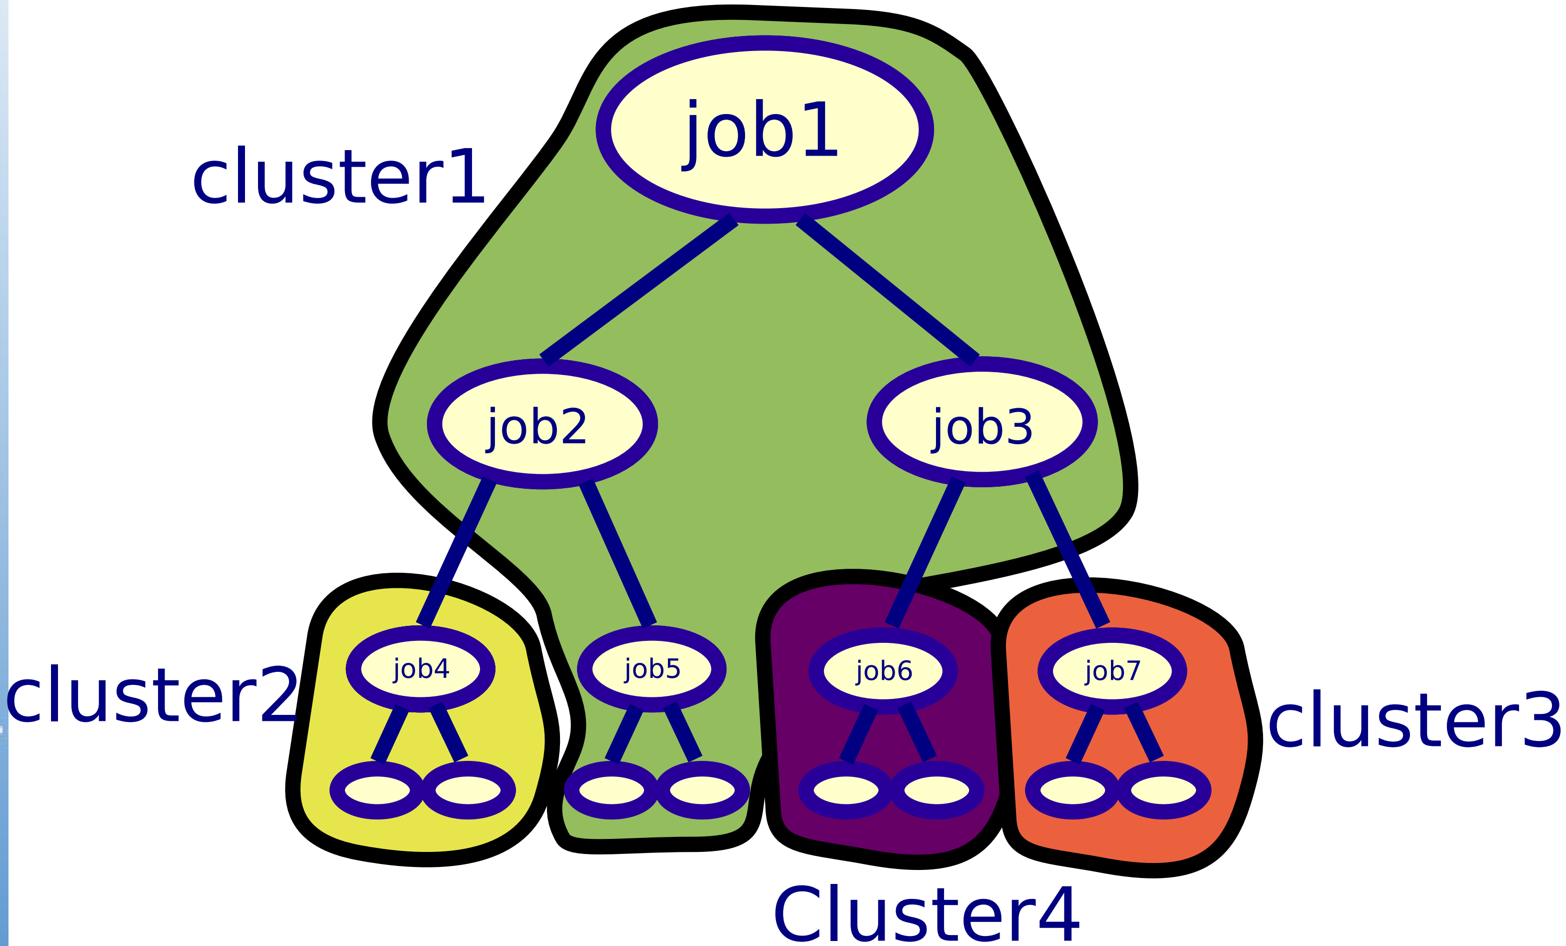
Satin – Malleability

- Transparently add machines



Satin – Malleability

- Transparently add machines

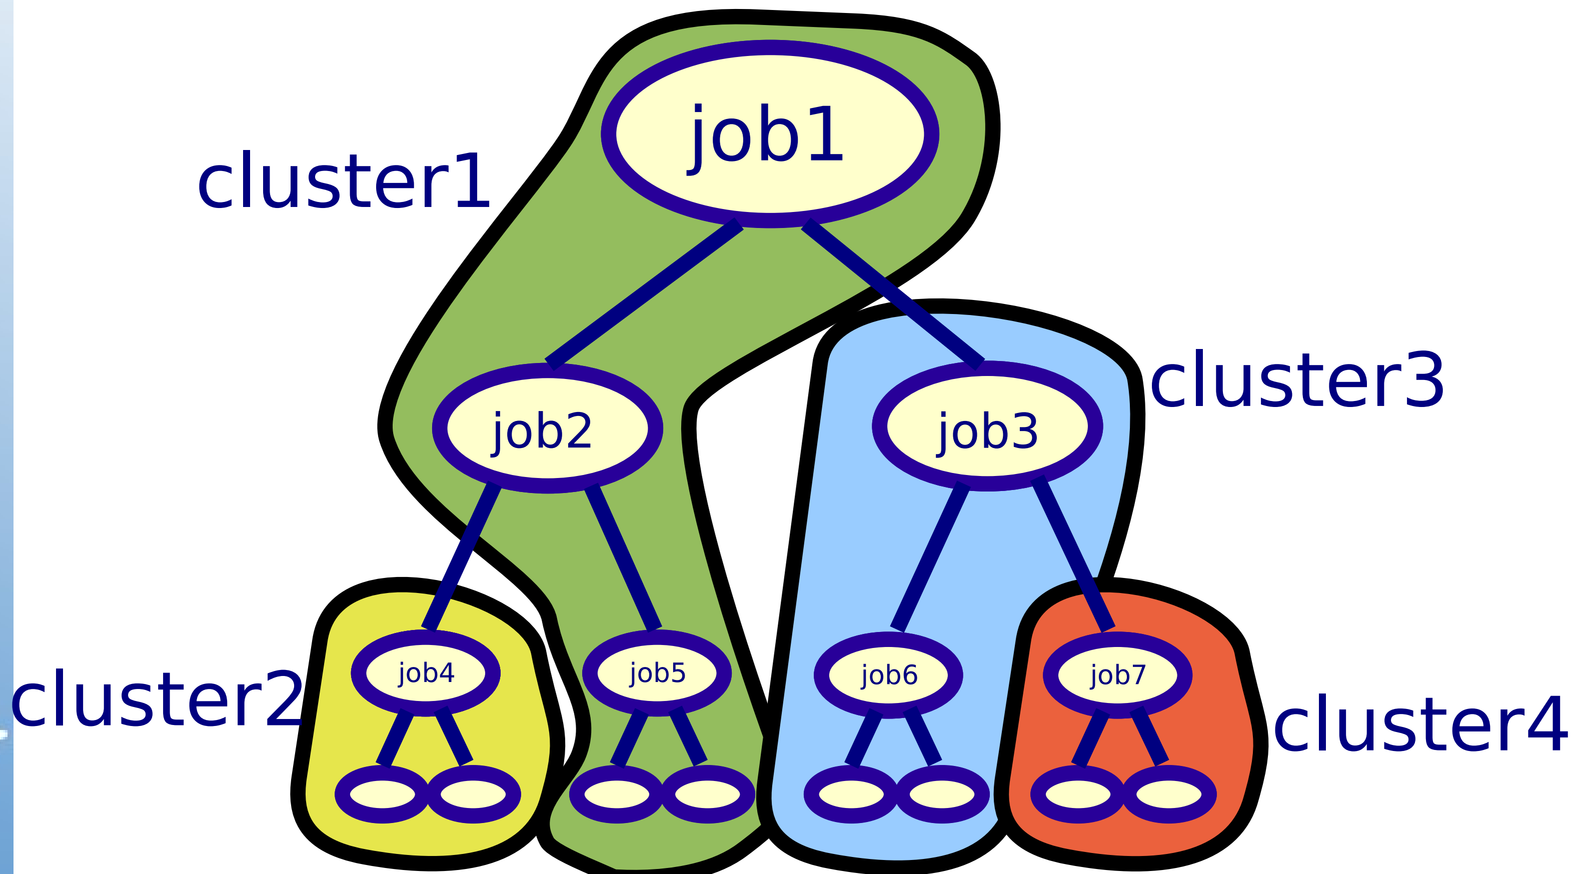


Satin – Fault Tolerance

- Machines can leave suddenly
  - Reservation can end without notification
  - Crashes
    - machines
    - network
    - software bugs
- Whole clusters can leave or crash
- The others continue the computation and automatically recompute lost work

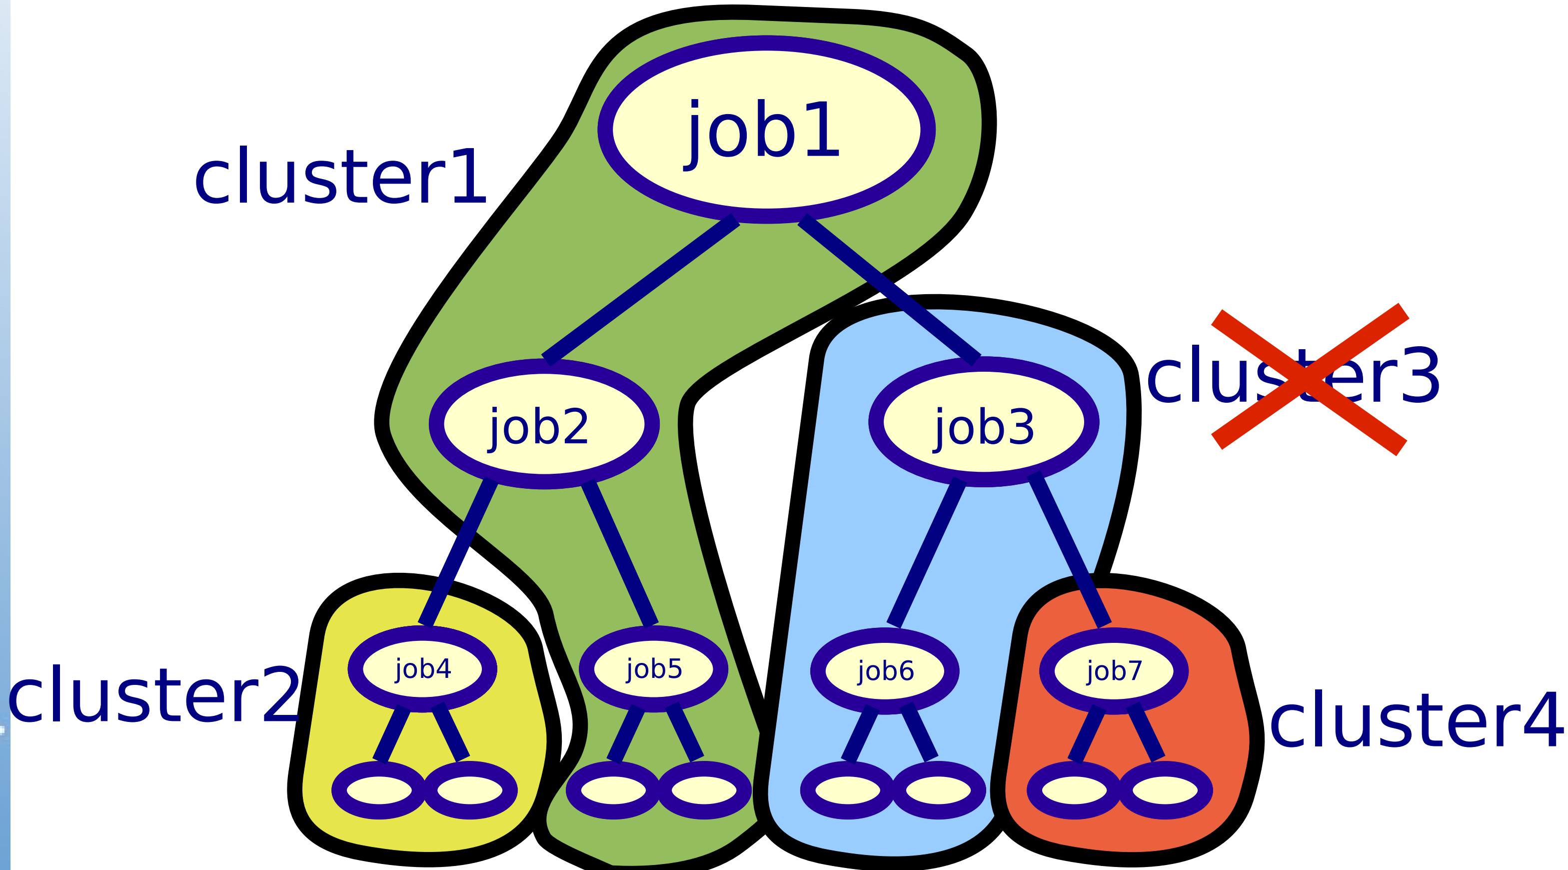
Satin – Fault Tolerance

- Transparent fault-tolerance



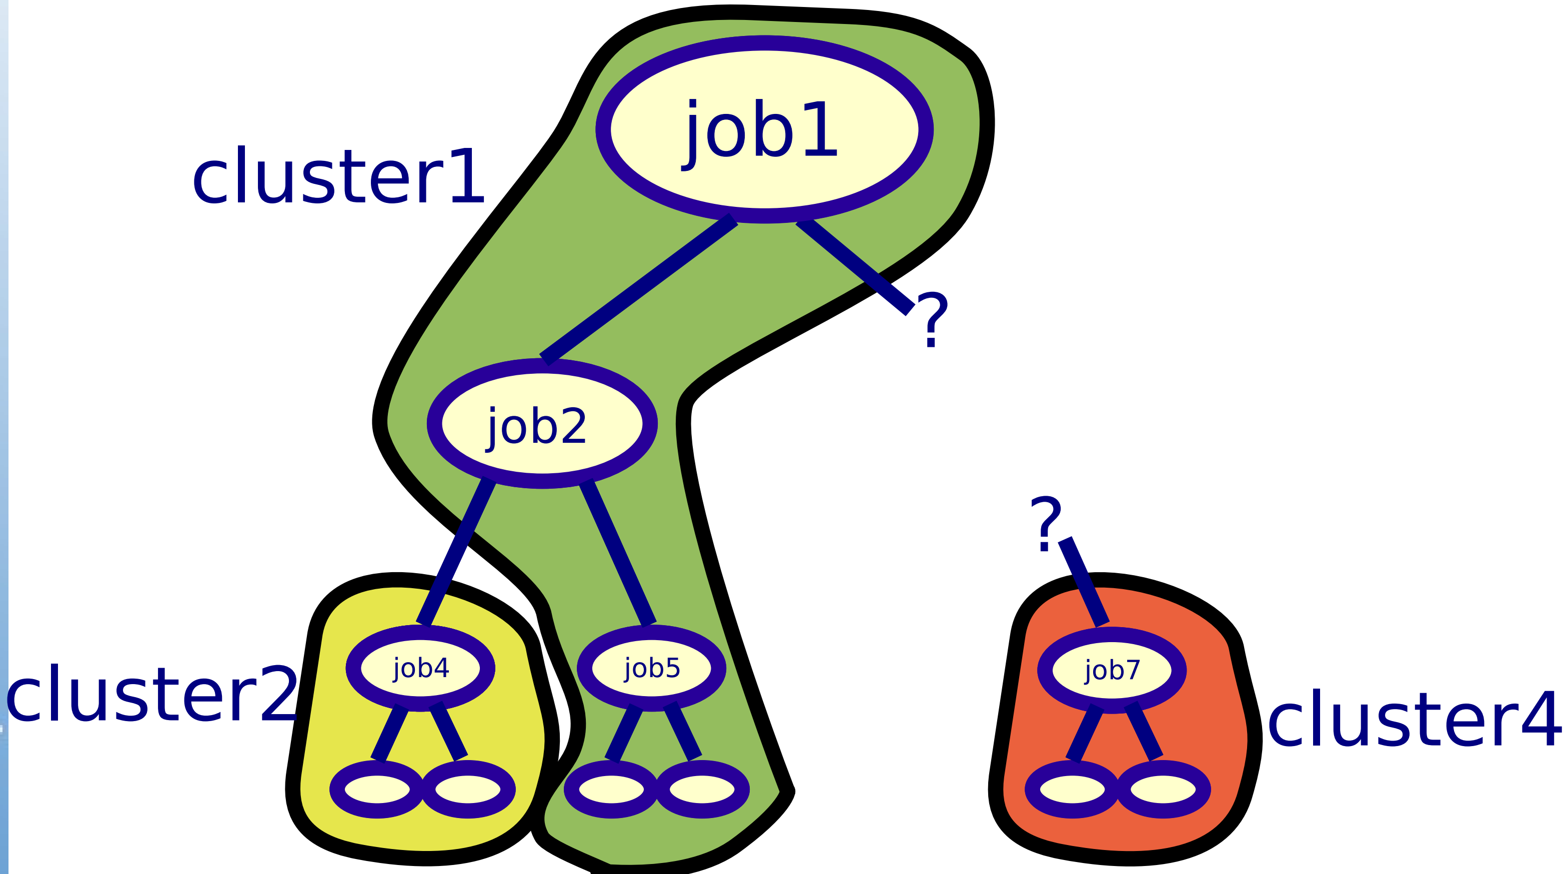
Satin – Fault Tolerance

- Transparent fault-tolerance



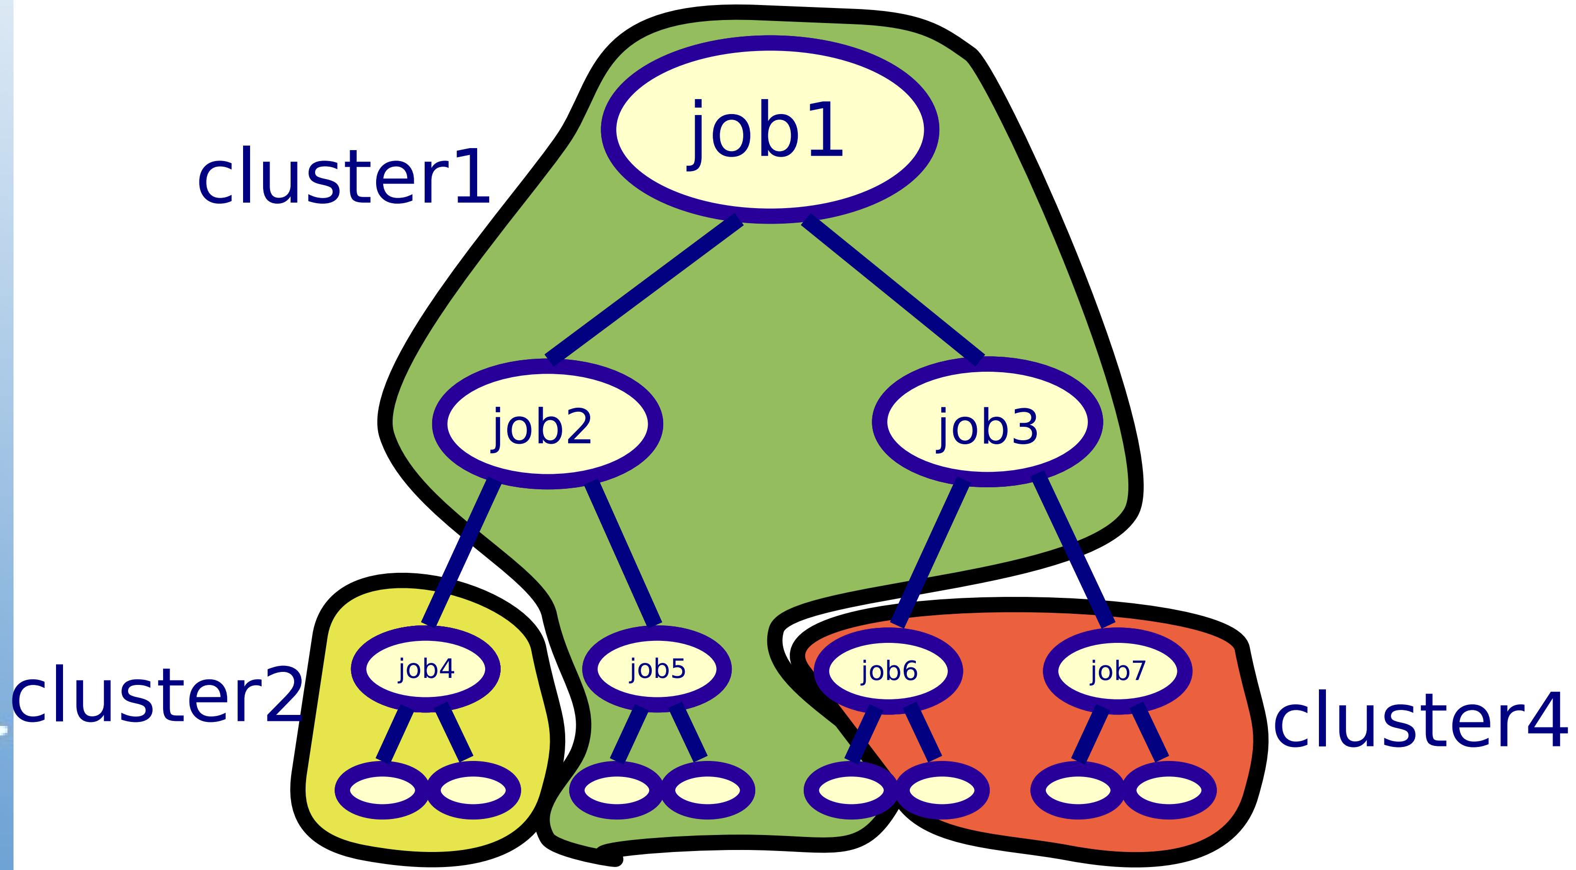
Satin – Fault Tolerance

- Transparent fault-tolerance



Satin – Fault Tolerance

- Transparent fault-tolerance



Satin – Migration

- Use malleability and fault tolerance
- Add new machines
- Remove old machines

Satin – Adaptivity

- **Automatically** adapt number of machines
- Depending on amount of parallelism in the application
  - Remove machines if application spawns few jobs
  - Add machines if application spawns many jobs, and machines are available
- If machines or networks become highly overloaded

ibis

vrije Universiteit

Satin Applications

- VLSI routing
- Satisfiability solver
- Gene sequencing
- N-body simulations
- Natural language learning
- Game-tree search
- Raytracing
- Numerical functions
- ...

Conclusion

- Satin provides a powerful programming model
- Extremely easy to use
- Satin is optimized for grid applications
- Satin allows applications to transparently deal with grid issues
  - load balancing, malleability, migration, fault-tolerance, adaptivity, firewalls, heterogeneity

vrije Universiteit

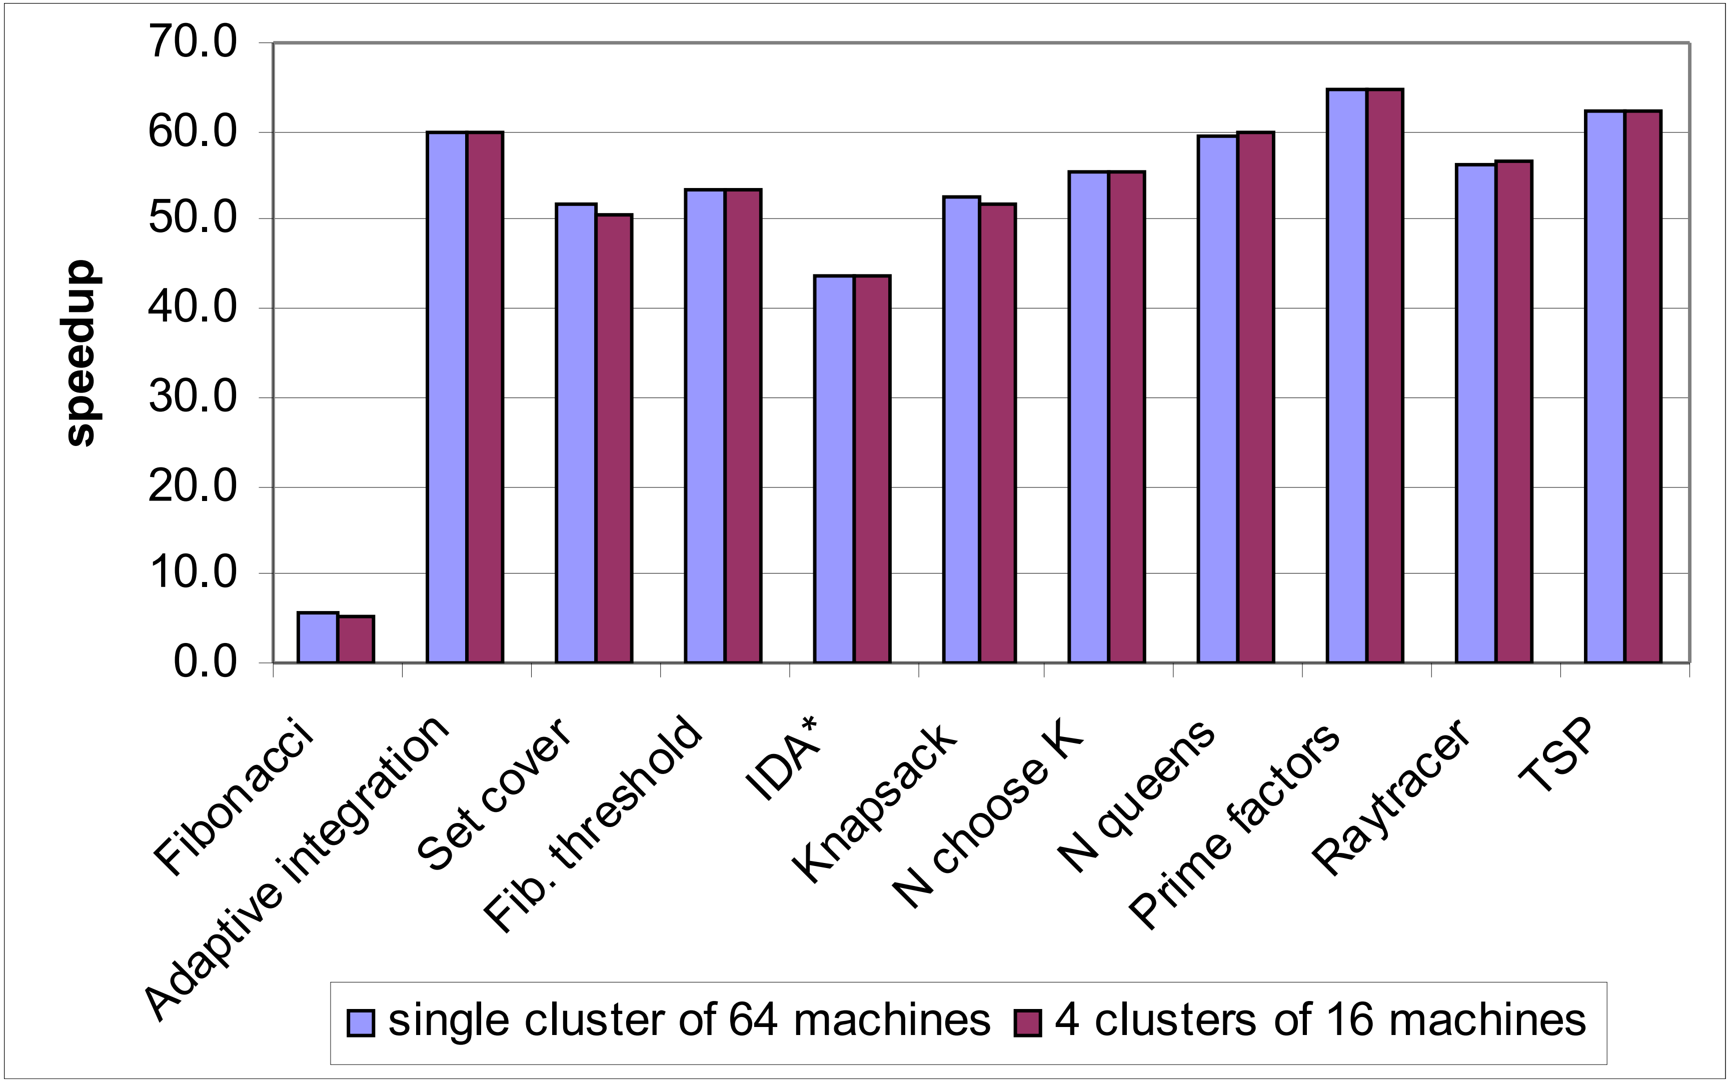
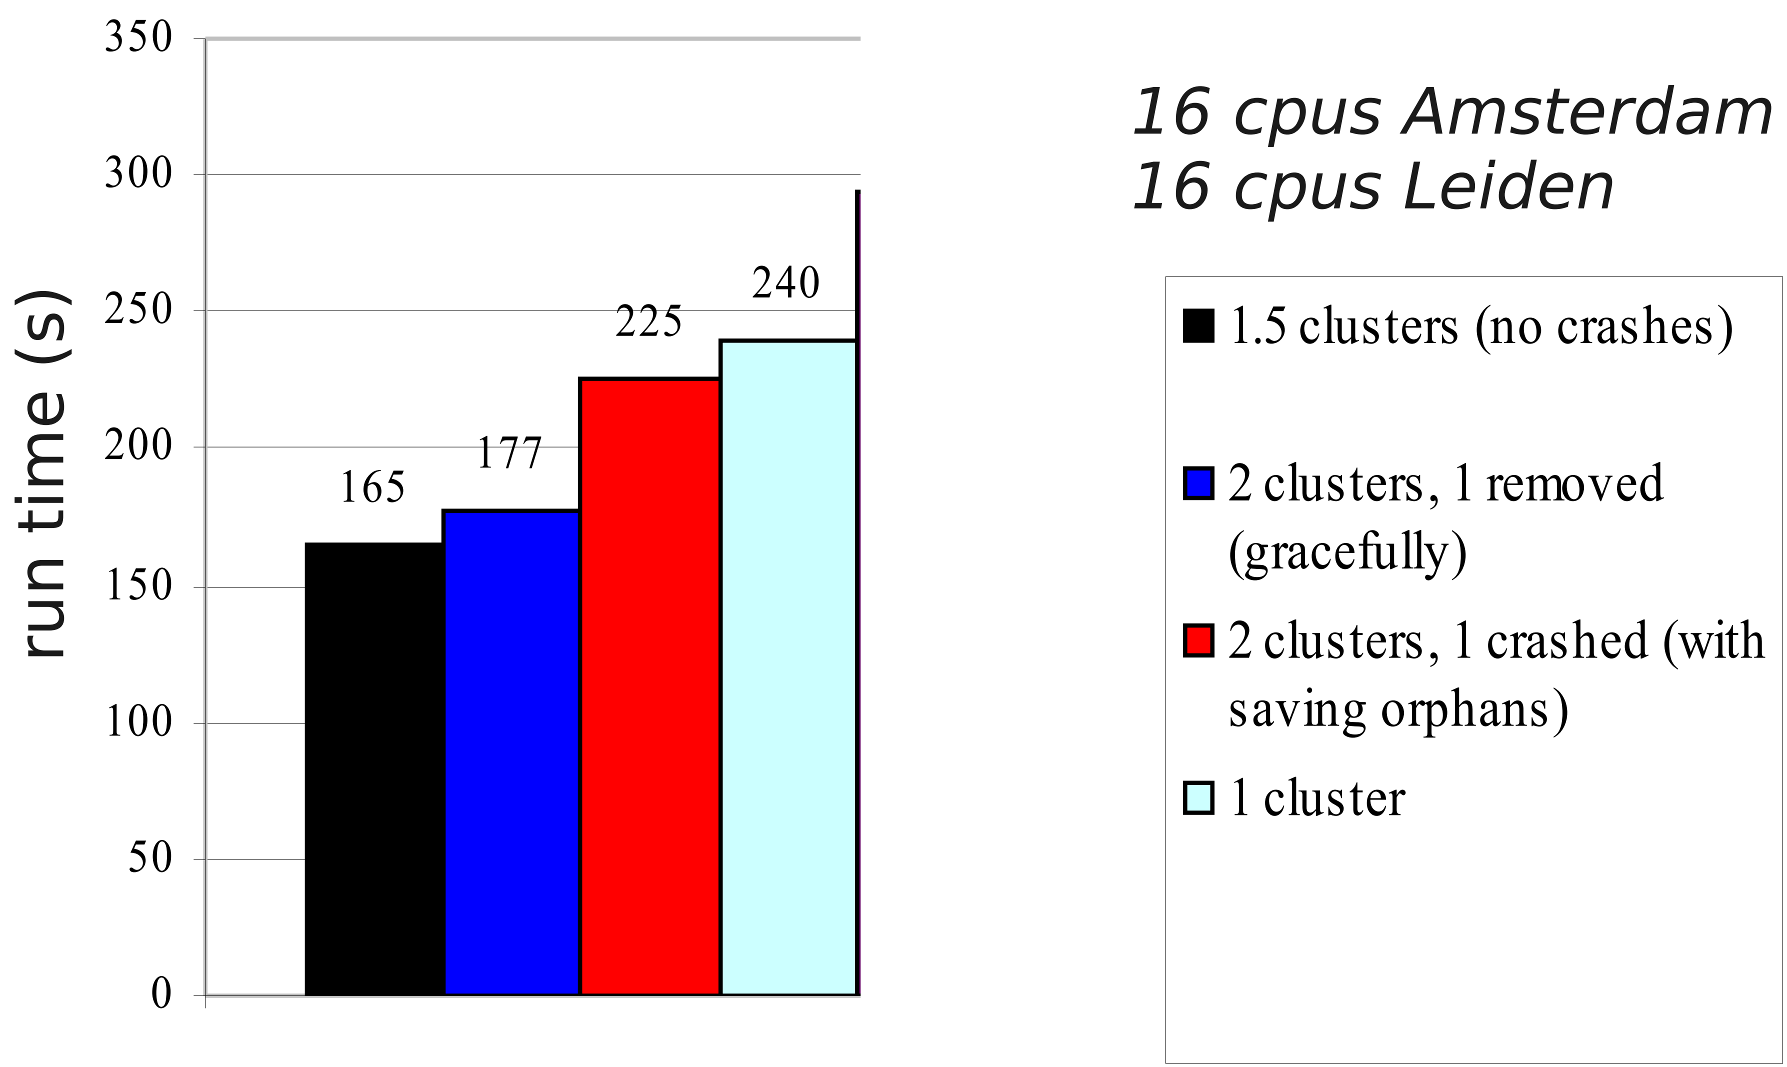
Satin – Load Balancing

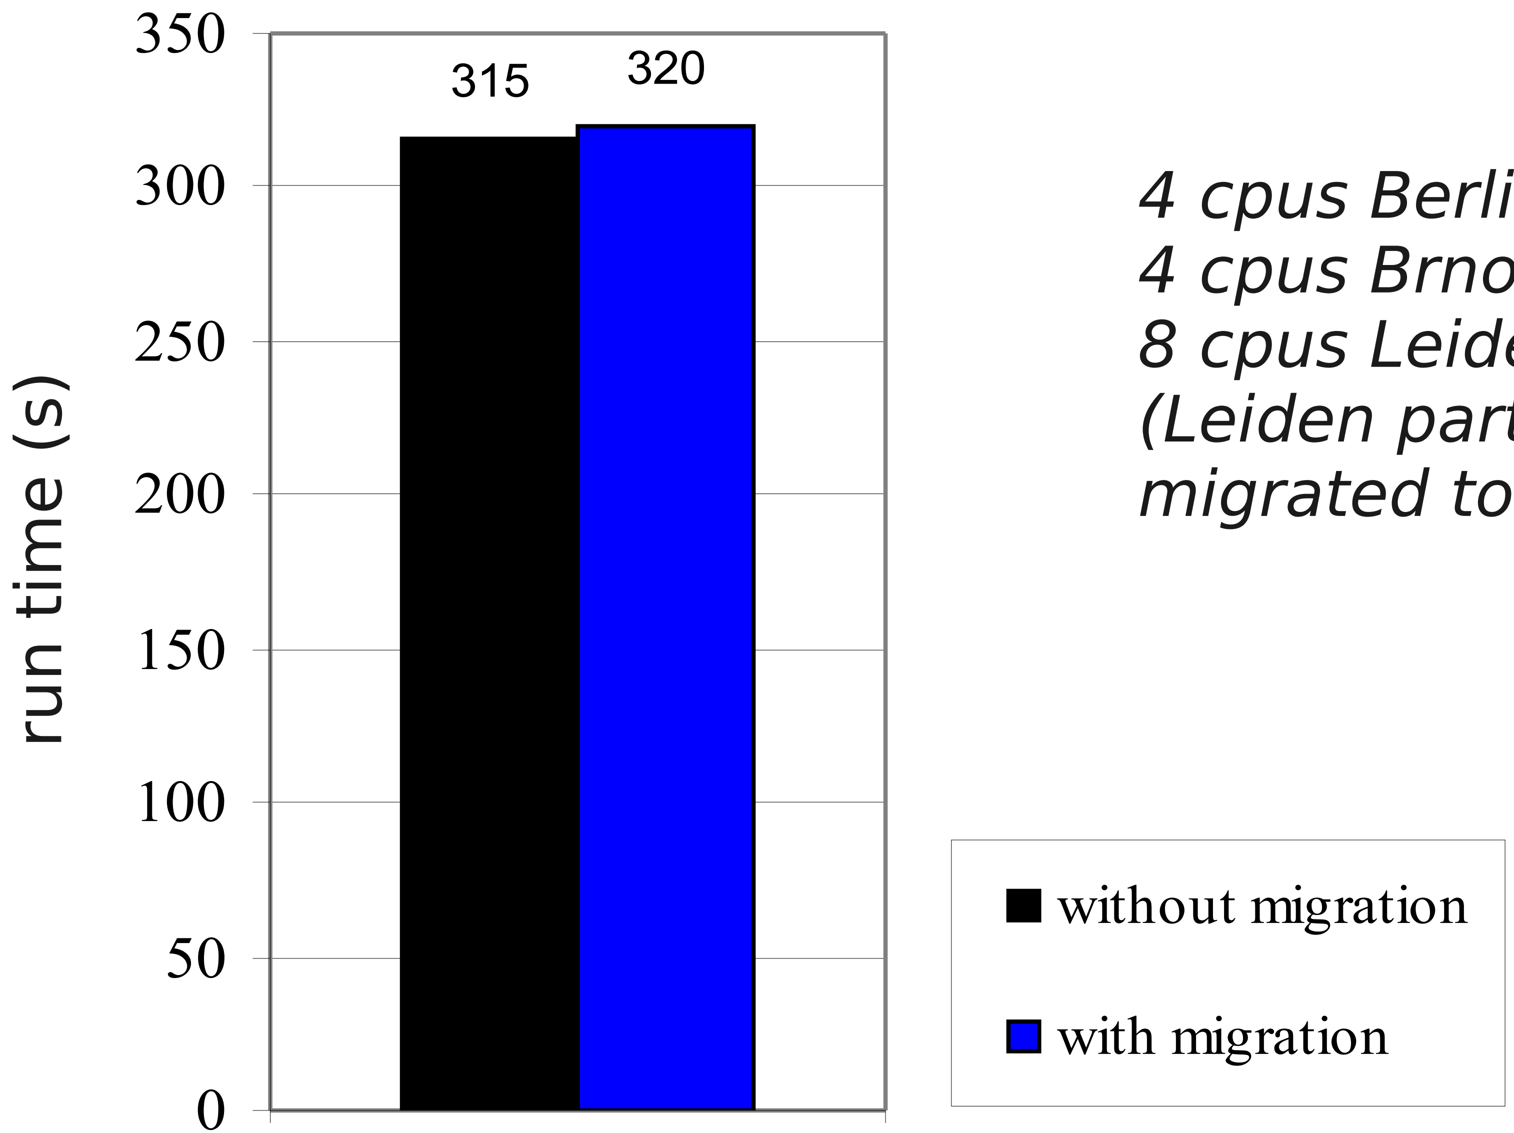


Satin – Fault Tolerance and Malleability Performance

16 cpus Amsterdam
16 cpus Leiden



Satin - Migration



4 cpus Berlin
4 cpus Brno
8 cpus Leiden
(Leiden part migrated to Delft)

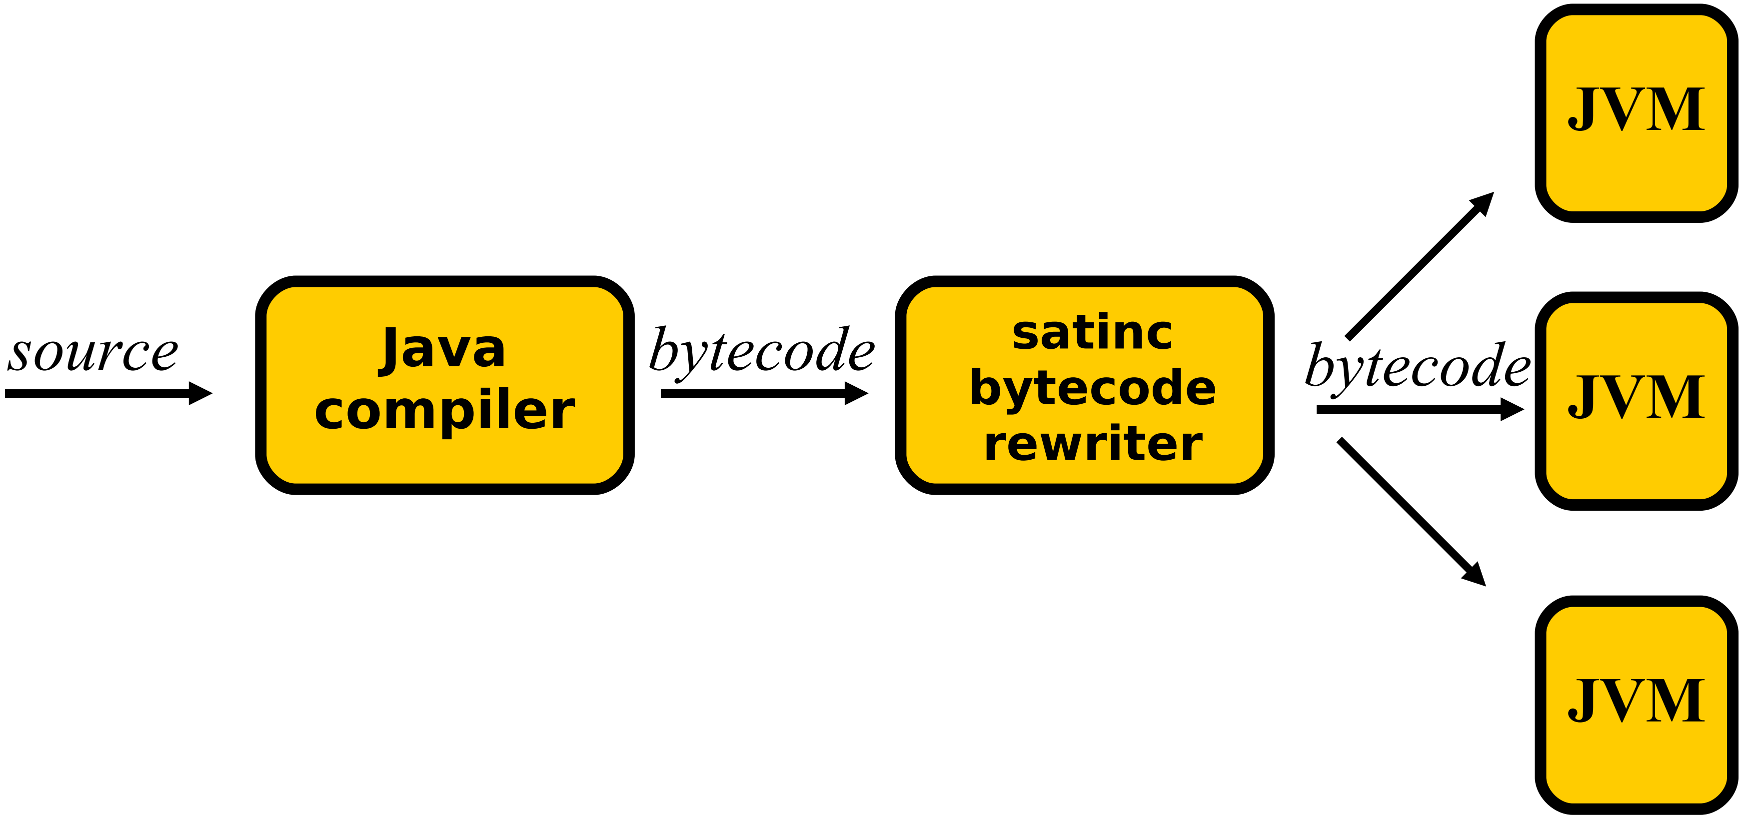
Satin – Load Balancing

- Automatic load-balancing
  - On a cluster: Random Stealing
    - Randomly select other node, and 'steal' the largest pending job it has available.
    - Proven optimal in homogeneous systems.
  - multiple clusters / grid: Cluster-aware RS.
    - Randomly select node in other cluster and send asynchronous steal request
    - Do RS in local cluster while waiting for reply.
    - Not proven optimal, but works well

Spawning Jobs

- If a job is executed on a remote machine, the parameters are sent over the network (i.e. copied)
- If a job is executed locally, copying overhead should be avoided
  - 99% of all jobs run locally
- Parameter passing semantics
  - Cannot assume either call-by-value or call-by-reference
  - If a parameter is changed, copy it first

Compiling Satin Programs



Summary: grid-enabling Satin

- The programming model itself
  - divide-and-conquer is inherently hierarchical: maps well on the grid
- Grid-aware load-balancing algorithm
  - Overlap wide-area communication with useful work
- Special consistency model for shared objects
  - Application defines consistency model
  - Allow different implementations
  - Special grid-aware multicast (if needed at all)
- Malleability, fault tolerance, migration, adaptivity
- Communicate through firewalls (thanks to Ibis)
- Portable (thanks to Java)
